

SMU Honors Physics Section

SMU Department of Physics
SPRING 2021

Professor Stephen Sekula

Syllabus for Honors Physics

General Information

The Honors Physics Section is intended to provide honors students with additional activities, information, and challenges to allow them to broaden and deepen their physics knowledge while concurrently taking the introductory physics course sequence. The framework of this syllabus is intended to allow honors students to go above and beyond the normal classroom environment without creating a huge additional burden on the students. Honors students should be looking to go a little further than non-honors students, and this syllabus reflects that.

Participants in the Honors Physics Section will engage in the following activities each semester:

- They will use class time to engage in learning exercises that synthesize information from the 130X introductory physics courses, allowing them to find more breadth and depth in the subject of physics.
 - They will have access to expertise from outside the classroom environment, including faculty, staff, and students from SMU and other institutions, as well as individuals with a physics background working in private industry. The goal here is to enrich their learning environment by giving them direct access to experts at various levels of the field.
 - They will engage in a coherent, semester-long project. Preparing for, and delivering, this project will be the focus of various activities throughout the semester. Honors students will be expected to learn to present their work to an audience, including (but not limited to) their peers in the Honors Physics Section.
 - Students will pass or fail the section based on an assessment of their work and participation, to be determined by the instructor.
-

Honors Physics Section - SPRING 2021

Professor Stephen Sekula

(Learning Assistant: TBD)

Students will engage in a semester-long “Grand Challenge” problem-solving exercise. This will define the arc of the semester, setting the tone for planning out classroom activities and eventually defining the deliverable at the end of the course. In between class periods relevant to the development of solutions to the Grand Challenge Problem, the students will be engaged in demonstrations of physics principles and exercises to explore these demonstrations. These class periods will follow a pattern consistent with the scientific method: observation of a physical phenomenon, hypothesis building to explain the phenomenon, and calculation and testing to assess the hypothesis. The details of this program are given below. Taking into account Thanksgiving in the Fall and Spring Break in the Spring, each semester has 14 weeks in which a classroom period or activity of the Honors Physics Section is possible.

Plan of Activities

WEEK	ACTIVITY
1	Introduction to the Honors Physics Section
2	Team and Mission Assignment: Physics Game Night
3	<i>Interactive Activity #1</i>
4	<i>Interactive Activity #2</i>
5	First “Honors Collaboration Meeting” Presentation of the three ideas on outcomes of the premise in the Grand Challenge Problem
6	<i>Interactive Activity #3</i>
7	How to Present Your Findings

SMU Physics Honors Section – SPRING 2021

9	Second “Honors Collaboration Meeting” Presentation of status of solutions to the Grand Challenge Problem, including first draft of your project media.
10	<i>Interactive Activity #1</i>
11	<i>Interactive Activity #2</i>
12	<i>Interactive Activity #3</i>
13	Third “Honors Collaboration Meeting” Final presentations of status of solutions to the Grand Challenge Problem, including project media drafts.
14	<i>PHYSICS DISCUSSION WEEK</i> (Each team meets with the instructors for 1 hour at a mutually determined time during the week. This substitutes for the regular class period)
15	Final Projects Presented All 130X students, SMU Physics Faculty and Graduate Students, and Friends of the Department are invited to engage in the projects.

Assessment

Student performance for Honors Credit will be assessed as follows:

- Participation in weekly classroom meetings
- Quality of presentations at “Honors Collaboration Meetings”
- Quality of final project media
- Quality of engagement with the audience for your final project

The Grand Challenge Problem

The focal event of each semester is the solving of a “Grand Challenge” problem. This is a physics problem with no textbook solution. Rather, you will draw upon your own creativity, informed by

SMU Physics Honors Section – SPRING 2021

the principles of physics you are learning in PHYS 130X, to address the question in as detailed a manner as possible. You will be assessed on:

- your incremental progress on developing answers to the question (see below);
- the creativity, originality, or novelty of the ideas that lead to your final answers;
- your ability to investigate the ideas through physics calculations and supporting material;
- and the reliability and accuracy of your calculations.

This is not purely a storytelling process; rather, you will engage in a mathematical and physical exercise where the math speaks, and you will describe what it says. The Grand Challenge process and solution will build gradually over the semester, woven into the fabric of the Honors Physics Section.

The Grand Challenge will be a team exercise¹. You will be randomly assembled into teams at the beginning of the semester. Your team will be expected to meet at least once a week outside of class to discuss the Grand Challenge and, in particular, how what you have learned that week might be used to explore a consequence of the theme of the Grand Challenge. Your team will report the status of your work (each individual presenting a brief, 5-minute overview of their status) at the “Honors Collaboration Meetings” - periods of in-class time (see schedule) devoted entirely to a public airing of progress. Members of other teams are free to ask questions and offer suggestions or criticism of presented work. In addition, one of our week's will be devoted to in-depth discussions on the physics principles and details; these discussions will happen outside of class time (instead of class period) between each team and the instructors. This entire exercise is to model how real, collaborative, scientific work, as well as peer review, operates in the real world.

A separate and detailed explanation of the entire Grand Challenge exercise will be made available by the instructor.

University Honor Code

¹ Depending on the number of students in the Honors Physics Section, we will revisit this aspect of the Grand Challenge Problem.

SMU Physics Honors Section – SPRING 2021

The student Honor Code² can be found in the SMU Student Handbook³. All students will be expected to adhere to it. Any student found cheating or plagiarizing another's work will be given a zero for that work and a complaint will be filed through the Vice President for Student Affairs Office. If you are uncertain of the definition of plagiarism as it regards independent works of mathematical and physical computation, documentation, and demonstration, it is your responsibility to speak with the instructor and understand these rules.

Disability Accommodations

Students needing academic accommodations for a disability must first register with Disability Accommodations & Success Strategies (DASS). Students can call 214-768-1470 or visit <http://www.smu.edu/Provost/SASP/DASS> to begin the process. Once approved and registered, students will submit a DASS Accommodation Letter to faculty through the electronic portal *DASS Link* and then communicate directly with each instructor to make appropriate arrangements. Please note that accommodations are not retroactive and require advance notice to implement.

University Policy on Religiously Observant Students

Religiously observant students wishing to be absent on holidays that require missing class should notify their professors in writing at the beginning of the semester, and should discuss with them, in advance, acceptable ways of making up any work missed because of the absence. (<https://www.smu.edu/StudentAffairs/ChaplainandReligiousLife/ReligiousHolidays>).

Excused Absences for University Extracurricular Activities

Students participating in an officially sanctioned, scheduled University extracurricular activity

² <http://www.smu.edu/StudentAffairs/StudentLife/StudentHandbook/HonorCode>

³ <http://www.smu.edu/StudentAffairs/StudentLife/StudentHandbook>

should be given the opportunity to make up class assignments or other graded assignments missed as a result of their participation. It is the responsibility of the student to make arrangements with the instructor prior to any missed scheduled examination or other missed assignment for making up the work. (See [2020-2021 University Undergraduate Catalogue](#) under “Excused Absences”)

Pregnant and Parenting Students

Under Title IX students who are pregnant or parenting may request academic adjustments by contacting Elsie Johnson (elsiej@smu.edu) in the Office of the Dean of Students, or by calling 214-768-4564. Students seeking assistance must schedule an appointment with their professors as early as possible, present a letter from the Office of the Dean of Students, and make appropriate arrangements. Please note that academic adjustments are not retroactive and, when feasible, require advance notice to implement.

COVID-19 Attendance Statement

Students who are experiencing COVID-19 symptoms or who have been notified through contact tracing of potential exposure and need to self-quarantine or isolate must follow the protocols laid out in [SMUs Contact Tracing Protocol](#). To ensure academic continuity, students in these situations will not be penalized and will be provided appropriate modifications to assignments, deadlines, and testing. Please also note that SMUFlex classes might, in rare circumstances, go remote for two-week periods to accommodate COVID-related issues. To ensure these necessary accommodations, affected students must:

- Provide as much advance notification as possible to the instructor about a change in circumstances. Students must notify their instructor about a potential absence as well as plans for a return to class. For cases in which students test positive for COVID-19, they should fill out a [CCC form at this link](#) (Links to an external site.)
- Communicate promptly with the instructor to establish, as necessary, alternative assignments and/or changes to deadlines and exams. Students are then responsible for meeting the expectations laid out in these alternative arrangements.
- Continue participation in class via Zoom, as health circumstances permit. Attend class regularly, when not in a situation outlined above, in accordance with safety measures laid out by [SMU CAN in the Pledge to Protect](#) (Links to an external site.) (including wearing

SMU Physics Honors Section – SPRING 2021

masks, maintaining social distancing, and cleaning personal space after class). In-person participation in SMUFlex classes is required on students assigned red/blue rotation days except in cases when students are experiencing illness, are in self-quarantine or in isolation.

- Students facing multiple or extended COVID-19-related absences or illness can work with the Office of the Dean of Students to consider options such as fully remote learning or medical withdrawal.

This policy, aligned with the [SMU Honor Code](#) and the [SMU Pledge to Protect](#), relies on mutual trust and respect between students and faculty to ensure safety, academic integrity, and instructional continuity.

Student Academic Success Programs

Students needing assistance with writing assignments for SMU courses may schedule an appointment with the Writing Center through Canvas. Students wishing support with subject-specific tutoring or success strategies should contact SASP, Loyd All Sports Center, Suite 202; 214-768-3648; <https://www.smu.edu/sasp>.

I-M-A Physicist

An Approach to Active Peer Learning

In this course, you are dropped into situations involving one or more physical phenomena and expected to explore, play, hypothesize, test, and share your results. These are the core traits of a good scientist. To help guide this process, which otherwise might lead you nowhere, please try to implement in some form the “I-M-A Physicist” approach in your group. Your groups typically contain 3 people. In the case that there are exactly three people, you should designate one person to fulfill each of the following roles in the group:

- **(I)nquirer:** this person asks questions about the phenomena, intended to inspire the other members of the team to take a step in inquiry. When another member of a team has drawn a conclusion, the inquirer might ask a challenge question. For instance, if the phenomenon demonstrated in the class is that two objects of different mass, dropped at the same time from the same height, are observed to reach the ground at the same time, an opening inquiry might be:
 - “I wonder whether the material that makes the objects has any effect on the outcome?”
- **(M) easurer:** this person’s job is to perform a measurement (or if more than one person is needed for measurement, coordinate the measurement between people) intended to gather data that addresses an inquiry. In the example above, the measurer’s job is to respond to the inquirer by proposing that different materials be dropped, whether of the same mass as one another or of different masses. The measurer’s job is to make sure the materials really do start at the same height, and to record (e.g. using a camera phone) the moment when they reach the ground. Measurement can take many forms: a meter stick and marked paper, a video, an audio recording, etc. Be creative! Use the tools you have in your pocket, or ask for tools you do not have.
- **(A) nalyst:** this person’s job is to take the data from the measurer and draw conclusions from it. Conclusions should be rooted in the data; no conclusion not supported by the data should be drawn. Perhaps this is by watching a video or listening to an audio recording, and stating a conclusion (or more than one) from what is recorded. Perhaps this is by reading marks made using a pencil and meter stick, or time measurements recorded in

SMU Physics Honors Section – SPRING 2021

a chart. Data takes many forms, and the Analyst's job is to determine what the data are saying.

Inquiry, Measurement, and Analysis (IMA) are core to the progress of knowledge using the scientific method. This way of thinking about roles in a team-based exercise can help guide you in learning how to conduct each step. In a real-world situation, each scientist is expected to conduct inquiry, measurement, and analysis, either by themselves or as part of a team.

If there are *MORE* than 3 team members, the others in the group can help with measurement and other activities, but at least one of them should be designated as a dedicated “opponent”:

- **(O)pponent:** this person's job is to challenge, in a constructive manner, any assumptions that are implicit in inquiry, measurement, or analysis, and to offer alternative explanations of the data that might be consistent with the data but not considered by the other members of the team. To be constructive, the opponent should not merely stand in the way of assumptions or conclusions, but offer a selection of next steps to eliminate or verify their opposition.

If there are only three members, all three team members should take the role of the Opponent after a round of Inquiry-Measurement-Analysis has concluded. Challenging assumptions and conclusions are essential to the progress of science; what differentiates science from other human endeavors is that a scientific opponent offers in return the test that verifies or refutes their challenge, and *accepts* the result of their proposed test (even if it dis-confirms their challenge), regardless of its outcome.

GRAND CHALLENGE PROBLEM (SPRING 2021)
